### Clinical Study for HS - Now Enrolling

**Hidradenitis suppurativa (HS)**, or acne inversa, is a skin condition that causes painful bumps, boils and/or abscesses to form under the skin. HS usually appears in areas where skin rubs together, such as the armpits, groin, inner thighs, buttocks and breasts. As HS gets more severe, these bumps, boils and/or abscesses grow deeper, and can rupture or leak and cause scarring.

HS develops after puberty or in early adulthood, and like many skin conditions can take a major toll on self-esteem and quality of life. Currently, there is no cure for HS, but researchers are studying new options that may be able to help.

Right now, doctors at select centers worldwide are accepting participants for a new clinical research study. The study is for an investigational medication for HS, taken once daily by mouth.

If you join, you will receive all study-related care and study medication at no cost, and may also be reimbursed for your time and travel to attend periodic visits to your local study center over approximately 13 months.

Hidradenitis suppurativa (HS) causes painful lumps under the skin, often in areas where skin rubs together

### Why Participate?

If you have hidradenitis suppurativa (HS), and have been prescribed in the past with an HS treatment that did not work well, you may qualify for a new clinical study. The study is for an investigational medication for HS, taken once daily by mouth. If you qualify and join the study, you may receive:

- ✓ Regular evaluations of your HS condition from a local specialist
- ✓ Study-related care and study medication at no cost
- ✓ Reimbursement for time and travel to attend periodic visits to your local study center over approximately 13 months
- ✓ The opportunity to help advance hidradenitis suppurativa research to potentially benefit others suffering from HS
